

 $({\tt works\ with\ about\ every\ distribution,\ except\ for\ apt-get\ which\ is\ Ubuntu/Debian\ exclusive})$

Legend:

Everything in "<>" is to be replaced, ex: <fileName> --> iLovePeanuts.txt
Don't include the '=' in your commands
'...' means that more than one file can be affected with only one command ex: rm
file.txt file2.txt movie.mov

Basic Commands

Basic file manipulation

ln -s file1 file2 = symbolic link

Basic Terminal Shortcuts

man <command> = shows manual (RTFM)

```
cat <fileName> = show content of file
CTRL L = Clear the terminal
CTRL D = Logout
                                                                                                      (less, more)
SHIFT Page Up/Down = Go up/down the terminal
                                                                                        head = from the top
CTRL A = Cursor to start of line
CTRL E = Cursor the end of line
                                                                                               -n <#oflines> <fileName>
CTRL U = Delete left of the cursor
CTRL K = Delete right of the cursor
                                                                                                -n <#oflines> <fileName>
CTRL W = Delete word on the left
CTRL Y = Paste (after CTRL U,K or W)
                                                                                       mkdir = create new folder
TAB = auto completion of file or command
                                                                                        mkdir myStuff ..
CTRL R = reverse search history
                                                                                       mkdir myStuff/pictures/ ..
!! = repeat last command
CTRL Z = stops the current command (resume with fg in foreground or bg in background)
                                                                                       cp image.jpg newimage.jpg = copy and rename a file
Basic Terminal Navigation
                                                                                        cp image.jpg <folderName>/ = copy to folder
                                                                                       cp image.jpg folder/sameImageNewName.jpg
cp -R stuff otherStuff = copy and rename a folder
cp *.txt stuff/ = copy all of *<file type> to folder
ls -a = list all files and folders
ls <folderName> = list files in folder
ls -lh = Detailed list, Human readable
ls -l *.jpg = list jpeg files only
ls -lh <fileName> = Result for file only
                                                                                       mv file.txt Documents/ = move file to a folder
                                                                                       mv <folderName> <folderName2> = move folder in folder
mv filename.txt filename2.txt = rename file
cd <folderName> = change directory
    if folder name has spaces use " "
                                                                                        mv <fileName> stuff/newfileName
                                                                                       mv <folderName>/ .. = move folder up in hierarchy
cd / = go to root
cd .. = go up one folder, tip: ../../
                                                                                       rm <fileName> .. = delete file (s)
                                                                                       rm -i <fileName> .. = ask for confirmation each file
rm -f <fileName> = force deletion of a file
du -h: Disk usage of folders, human readable
du -ah: "" files & folders, Human readable
                                                                                       rm -r <foldername>/ = delete folder
du -sh: only show disc usage of folders
                                                                                       touch <fileName> = create or update a file
pwd = print working directory
                                                                                       ln file1 file2 = physical link
```

Basic Commands

Extract, sort and filter data

more info: man cut, man sort, man grep

Researching Files

```
The slow method (sometimes very slow):
                                                                             grep <someText> <fileName> = search for text in file
                                                                                   -i = Doesn't consider uppercase words
locate <text> = search the content of all the files
                                                                                   -I = exclude binary files
locate <fileName> = search for a file
sudo updatedb = update database of files
                                                                             grep -r <text> <folderName>/ = search for file names
    with occurrence of the text
find = the best file search tool(fast)
                                                                            With regular expressions:
find -name "<fileName>"
find -name "text" = search for files who start with the word text
find -name "*text" = " " " end " " "
                                                                             grep -E ^<text> <fileName> = search start of lines
                                                                             with the word text
                                                                             grep -E <0-4> <fileName> =shows lines containing numbers 0-4
                                                                             grep -E <a-zA-Z> <fileName> = retrieve all lines
Advanced Search:
                                                                            with alphabetical letters
Search from file Size (in ~)
       find \sim -size +10M = search files bigger than.. (M,K,G)
                                                                             sort = sort the content of files
                                                                             sort <fileName> = sort alphabetically
                                                                             sort -o <file> <outputFile> = write result to a file
Search from last access
      find -name "<filetype>" -atime -5
('-' = less than, '+' = more than and nothing = exactly)
                                                                            sort -r <fileName> = sort in reverse
sort -R <fileName> = sort randomly
                                                                             sort -n <fileName> = sort numbers
Search only files or directory's
       find -type d --> ex: find /var/log -name "syslog" -type d find -type f = files
                                                                             wc = word count
                                                                            More info: man find, man locate
                                                                             cut = cut a part of a file
                                                                             -c --> ex: cut -c 2-5 names.txt
                                                                                   (cut the characters 2 to 5 of each line)
```

Basic Commands

Time settings (continued) date = view & modify time (on your computer) crontab = execute a command regularly -e = modify the crontab -l = view current crontab date "+%H" --> If it's 9 am, then it will show 09 date "+%H:%M:%Ss" = (hours, minutes, seconds) -r = delete you crontab In crontab the syntax is <Minutes> <Hours> <Day of month> <Day of week (0-6, %Y = years 0 = Sunday)> <COMMAND> MMDDhhmmYYYY ex, create the file movies.txt every day at 15:47: 47 15 * * * touch /home/bob/movies.txt * * * * * --> every minute Month | Day | Hours | Minutes | Year sudo date 031423421997 = March 14th 1997, 23:42 at 5:30 in the morning, from the $\mathbf{1}^{\text{st}}$ to $\mathbf{15}^{\text{th}}$ each month: Execute programs at another time 30 5 1-15 * * at midnight on Mondays, Wednesdays and Thursdays: 00 * * 1,3,4 use 'at' to execute programs in the future every two hours: 0 */2 * * * Step 1, write in the terminal: at <timeOfExecution> ENTER ex --> at 16:45 or at 13:43 7/23/11 (to be more precise) every 10 minutes Monday to Friday: */10 * * * 1-5 or after a certain delay: at now +5 minutes (hours, days, weeks, months, years) Step 2: <ENTER COMMAND> ENTER Execute programs in the background repeat step 2 as many times you need Step 3: CTRL D to close input Add a '&' at the end of a command ex --> cp bigMovieFile.mp4 & atq = show a list of jobs waiting to be executed nohup: ignores the HUP signal when closing the console $atrm = delete a job n^{\circ} < x >$ (process will still run if the terminal is closed) ex (delete job #42) --> atrm 42 ex --> nohup cp bigMovieFile.mp4 sleep = pause between commands jobs = know what is running in the background with ';' you can chain commands, ex: touch file; rm file you can make a pause between commands (minutes, hours, days)

ex --> touch file; sleep 10; rm file <-- 10 seconds

fg = put a background process to foreground

ex: fg (process 1), f%2 (process 2) f%3, ...

Basic Commands

Process Management

w = who is logged on and what they are doing

tload = graphic representation of system load average

ps = Static process list -ef --> ex: ps -ef | less -ejH --> show process hierarchy -u --> process's from current user

top = Dynamic process list While in top:

- q to close top
- h to show the help
- k to kill a process

CTRL C to top a current terminal process

kill = kill a process
 You need the PID # of the process ps -u <AccountName> | grep <Application> kill <PID> ... kill -9 <PID> = violent kill

killall = kill multiple process's ex --> killall locate

sudo halt <-- to close computer sudo reboot <-- to reboot

Create and modify user accounts

sudo adduser bob = root creates new user sudo passwd <AccountName> = change a user's password sudo deluser <AccountName> = delete an account

addgroup friends = create a new user group delgroup friends = delete a user group

usermod -g friends <Account> = add user to a group usermod -g bob boby = change account name usermod -aG friends bob = add groups to a user with-out loosing the ones he's already in

File Permissions

chown = change the owner of a file
 ex --> chown bob hello.txt ex --> chown bob hello.txt

chown user:bob report.txt = changes the user owning
report.txt to 'user' and the group owning it to 'bob'

-R = recursively affect all the sub folders

ex --> chown -R bob:bob /home/Daniel

 ${\sf chmod} \; = \; {\sf modify} \; \; {\sf user} \; \; {\sf access/permission} \; - \; {\sf simple} \; \; {\sf way} \; \\$ u = user

g = group

d = directory (if element is a directory)
l = link (if element is a file link)

r = read (read permissions)

w = write (write permissions)
x = eXecute (only useful for scripts and programs)

Basic Commands

File Permissions (continued)

'+' means add a right '-' means delete a right '=' means affect a right ex --> chmod g+w someFile.txt (add to current group the right to modify someFile.txt)

more info: man chmod

Flow redirection

Redirect results of commands:

'>' at the end of a command to redirect the result to a file ex --> ps -ejH > process.txt '>>' to redirect the result to the end of a file

Redirect errors:

'2>' at the end of the command to redirect the result to a file ex --> cut -d , -f 1 file.csv > file 2> errors.log '2>&1' to redirect the errors the same way as the standard output

Read progressively from the keyboard

<Command> << <wordToTerminateInput>

ex --> sort << END <-- This can be anything you want > Hello

- > Cinema
- > Game > Code > Ubuntu
- > END

Flow Redirection (continued)

terminal output:

Alex Cinema

Game Ubuntu

Another example --> wc -m << END

Chain commands

'|' at the end of a command to enter another one ex --> du | sort -nr | less

Archive and compress data

Archive and compress data the long way:

Step 1, put all the files you want to compress in the same folder: ex --> mv *.txt folder/

Step 2, Create the tar file:

- tar -cvf my_archive.tar folder/
 - -c : creates a .tar archive
 -v : tells you what is happening (verbose)
 - -f : assembles the archive into one file

Step 3.1, create gzip file (most current):
gzip my_archive.tar
to decompress: gunzip my_archive.tar.gz

Step 3.2, or create a bzip2 file (more powerful but slow): bzip2 my_archive.tar to decompress: bunzip2 my_archive.tar.bz2

Basic Commands

Archive and compress data (continued)

step 4, to decompress the .tar file: tar -xvf archive.tar archive.tar

Archive and compress data the fast way:

gzip: tar -zcvf my_archive.tar.gz folder/ decompress: tar -zcvf my_archive.tar.gz Documents/

Show the content of .tar, .gz or .bz2 without decompressing it:

gzip -ztf archive.tar.gz

bzip2:

bzip2 -jtf archive.tar.bz2

tar:

tar -tf archive.tar

tar extra:

tar -rvf archive.tar file.txt = add a file to the .tar

You can also directly compress a single file and view the file without decompressing:

Step 1, use gzip or bzip2 to compress the file: gzip numbers.txt

Step 2, view the file without decompressing it: zcat = view the entire file in the console (same as cat)
zmore = view one screen at a time the content of the file (same as more)
zless = view one line of the file at a time (same as less)

Installing software

When software is available in the repositories: sudo apt-get install <nameOfSoftware> ex--> sudo apt-get install aptitude

If you download it from the Internets in .gz format (or bz2) - "Compiling from source" $\,$ Step 1, create a folder to place the file: mkdir /home/username/src <-- then cd to it

Step 2, with 'ls' verify that the file is there (if not, mv ../file.tar.gz /home/username/src/)

Step 3, decompress the file (if .zip: unzip <file>)

Step 4, use 'ls', you should see a new directory Step 5, cd to the new directory

Step 6.1, use 1s to verify you have an INSTALL file, then: more INSTALL

If you don't have an INSTALL file:

Step 6.2, execute ./configure <-- creates a makefile Step 6.2.1, run make <-- builds application binaries Step 6.2.2 : switch to root --> su Step 6.2.3 : make install <-- installs the software

Step 7, read the readme file
